

Thomas Hospital Foundation Raises Funds for HD-Equipment

The technological advancement of high-definition (HD) imagery to improve picture clarity and detail is now also being used at Thomas Hospital and Thomas Medical Center by surgeons performing minimally invasive laparoscopic surgeries. The same advanced technology that provides more realistic images on home televisions also allows for greater precision during surgery and easier detection of disease.

“The equipment gives our physicians more accurate results and ultimately improves the quality of care for our patients,” says Robbie Rainer, director of surgery at Thomas Hospital.

The Thomas Hospital Foundation raised \$450,000, including \$168,000 in donations from the Thomas Hospital Auxiliary, to assist the hospital in purchasing the equipment.

“With the help of the community, Thomas Hospital continues to offer the latest in technology to our patients,” explains hospital administrator Phil Cusa. “The HD equipment allows our surgeons to provide world-class healthcare that our patients expect from our hospital.”
